Call for Papers

The 33rd Microelectronics Design & Test Symposium (IEEE MDTS 2024)

May 13 – 15, 2024 Crowne Plaza Albany - The Desmond Hotel in Albany, New York

http://mdts.ieee.org

Key Dates

Full Paper or Extended Summary: 02/22/2024 Notification of Acceptance: 04/01/2024 Final Paper Submission: 05/01/2024

Organizing Committee

General Chair Kelly Ockunzzi – Marvell Vice General Chair Andy Laidler - onsemi Program Chair Uma Srinivasan – IBM Vice Program Chair Huamin Li – Univ. at Buffalo Past General Chair Eugene Atwood - IBM Tutorial Co-Chairs Carl Wisnesky – Cadence Krishna Chakravadhanula – Cadence Special Session Chair Qiaoyan Yu (Univ. of New Hampshire) Nathaniel Cady (Univ. at Albany) Panel Chair Malinky Ghosh – IBM Finance & Registration Charles Thangaraj - Univ. of St. Thomas Rvan Patterson - CACI Xinghao Chen – IEEE Ted Cooley – Cooley & Company Publication Chair Themistoklis Haniotakis – S. Illinois Univ. Vice Publication Chair Tian Xia - Univ. of Vermont **Publicity Chair** Eric Hunt-Schroeder - Marvell Web Master Yu Zhang – Aptiv

Steering Committee

Vishwani Agrawal – Auburn Univ. Xinghao Chen – IEEE Ted Cooley – Cooley & Company Jennifer Dworak – SMU Brion Keller – Lockheed Martin Karen Panetta – Tufts University Paul Reuter – Siemens EDA Peilin Song – IBM Research Tian Xia – Univ. of Vermont Krishnat Patil – IEEE Schenectady Charles Rubenstein – Pratt Institute Eugene Atwood – IBM

Theme Advances and Challenges for Chiplets and for Hardware Security

The IEEE Microelectronics Design & Test Symposium (MDTS) provides a forum for academic and industry researchers and engineers to discuss the latest advances in microelectronics, share their visions in modern microelectronic technologies, and foster academic-industry collaboration. The 33rd MDTS explores challenges and advances on two major fronts: chiplets and hardware security. Chiplets break large chip designs into smaller, ideally reusable, blocks, and the Universal Chiplet Interconnect Express (UCle) standard addresses the challenges of connecting chiplets in the package. Hardware security for chip designs covers a broad range of issues, from preventing reverse engineering to blocking takeovers and data theft or manipulation. Topics of interest include but are not limited to:

Micro Devices, Circuits and Microsystems: Analog/mixed-signal/radio frequency (RF) circuits; Low-power low-voltage design; Sensors and sensing systems; Smart system design for automotive, automation and robotics; Circuits and systems for approximate and evolvable computing; Memristorbased devices; Lab-on-Chip, wearable and implantable devices; Heterogeneous integration and multiscale chiplet-based packaging architecture

Biomedical, Photonics, and Quantum Electronics: Biomedical and bio-inspired circuits and systems; Microelectromechanical systems (MEMS) sensors and bioelectronics; Nanobiophotonics for optical imaging, sensing, and diagnostics; Terahertz photonics for communications; Photodetectors, sensors, and imaging; Photonics for energy and green photonics

Electronic Design & Test Methodologies and Electronic Design Automation (EDA): Electronic design tools, processes and methodologies; EDA for 3D integrations and advanced packaging; EDA for bio-inspired and neuromorphic systems; EDA tools, methodologies and applications for Photonics devices, circuit, and system design; System-on-Chip (SoC)/intellectual property (IP) testing strategies; Hardware/software co-verification; Design for testability (DFT) & built-in self-test (BIST) for digital designs, analog/mixed-signal integrated circuits (ICs), SoCs, and memories; Design verification/validation; Machine learning datasets for microelectronics design and test

Hardware Security: Microarchitectural attacks; Side channel attacks and mitigation; (Anti-)Reverse engineering and physical attacks; Hardware obfuscation; Computer-aided design (CAD) for security; SoC security, Field-programmable gate array (FPGA) and reconfigurable fabric security; Internet-of-Things (IoTs) and cyber physical system security

Emerging Technologies and Applications: Computing-in-memory architectures; Neural networks, Al, ML, and DL in design and test of microelectronics; IoT, edge nodes, or pipelines for real-time data visualizations and monitoring in design and test of microelectronics; Application of cognitive, neuromorphic and quantum computing; High-speed serializer/deserializer (SerDes); Next-generation design-technology co-optimization; Advanced interconnect; 3D manufacturing

The Program Committee invites researchers and practitioners to submit tutorial, panel, and special session proposals related to the theme. Proposals must include title, topic abstract, speakers' short bio, and a list of contributing papers. The committee also encourages authors to submit original, unpublished papers on any of the topics of interest. Submissions may be six-page full papers or two-page extended summaries. Accepted papers presented at the symposium have the option of being published in IEEE *Xplore*®. Full details can be found on the **mdts.ieee.org** website.

Jake Karrfalt Best Student Paper Award

To encourage student participation in the microelectronics research community, MDTS will recognize the top student first-author paper and presentation.
